

Professional Dubbing and Recording Software

NGest provides functionality that's key to the content workflow — managing the transfer of material from one format to another, from device to device or from device to multiple devices. NVerzion takes material from tape-to-tape, tape-to-video server, or video server-to-video server with a host of optional interfaces all designed to make your system efficient and easy to control. Simply assign source, destination, encoding rates, and other clip-specific values within a single intuitive interface.

Optional linking to NVerzion's machine control application, EMC-NT, provides an easy interface with multiple file destinations and archives. NVerzion can even be configured to import a dub list provided by a facility's existing traffic system.

The utility and flexibility of NVerzion are further enhanced by optional router control available via NVerzion's EMC-Router application. The fully configurable GUI allows users to simply add up to four additional destinations to which assets can be sent — whatever matches the specific workflow requirements.

Benefits:

- Accurately transfer material from any source to any destination
- Optional video monitor lets you watch the material you're recording
- Automatically name, segment, and mark clips during recording
- Easily control source and destination devices

Features:

- Frame-accurate recording
- Standardized interface and protocol between any number of digital storage devices
- Source metadata retained in database
- Variable pre-roll and bit rate, jog and shuttle, barcode scanner
- Dub lists, purge lists, delete lists
